

Access control

This page describes the access control options available to you in Cloud Composer API.

Overview

Cloud Composer API uses [Identity and Access Management \(IAM\)](#) (/iam) for access control.

In the Cloud Composer API, access control can be configured at the *project level*. For example, you can grant access to all Cloud Composer API resources within a project to a group of developers.

For a detailed description of IAM and its features, see the [IAM documentation](#) (/iam/docs). In particular, see [Managing IAM Policies](#) (/iam/docs/managing-policies).

Every Cloud Composer API method requires the caller to have the necessary permissions. See [Permissions and roles](#) (#permissions) for more information.

Cloud Composer creates [Google-managed service accounts](#) (/iam/docs/service-accounts) for the services attached with your environment. The service accounts have the appropriate permissions to manage your environment and execute workflows. To avoid access control issues, do not remove or change the service account's role or permissions.

Required permissions

The following table lists the permissions that the caller must have to call each API method in the Cloud Composer API or to perform tasks using Google Cloud tools that use the API, such as Google Cloud Console or Cloud SDK.

By default, Cloud Composer environments run using the Compute Engine default service account. During environment creation, you can specify a custom service account. At minimum, this service account requires the permissions that the `composer.worker` role provides to access resources in the Cloud Composer environment. You are authorized to "act as" the service account by having the `iam.serviceAccounts.actAs` permission enabled on the service account or project that contains the environment. Please note that the Composer Administrator role by it

ot provide this permission. For more information, see [Creating environments](#) ([composer/docs/how-to/managing/creating#access-control](#)).

Method	Permission
<code>environments.create</code>	<code>composer.environments.create</code> iam.serviceAccounts.actAs (on the service account under which the environment will run)
<code>environments.delete</code>	<code>composer.environments.delete</code>
<code>environments.get</code>	<code>composer.environments.get</code>
<code>environments.list</code>	<code>composer.environments.list</code>
<code>environments.update</code>	<code>composer.environments.update</code>
<code>operations.delete</code>	<code>composer.operations.delete</code>
<code>operations.get</code>	<code>composer.operations.get</code>
<code>operations.list</code>	<code>composer.operations.list</code>

Roles

Role	Title	Description	Permissions
<code>roles/composer.admin</code>	Composer Administrator	Provides full control of Cloud Composer resources.	<code>composer.*</code> <code>serviceusage.quotas.get</code> <code>serviceusage.services.get</code> <code>serviceusage.services.list</code>

Role	Title	Description	Permissions
<code>roles/composer.environmentAndStorageObjectAdmin</code>	Environment and Storage Object Administrator	Provides full control of Cloud Composer resources and of the objects in all project buckets.	<code>composer.*</code> <code>resourcemanager.projects.resourcemanager.projects.serviceusage.quotas.get</code> <code>serviceusage.services.get</code> <code>serviceusage.services.list</code> <code>storage.objects.*</code>
<code>roles/composer.environmentAndStorageObjectViewer</code>	Environment and Storage Object Viewer	Provides the permissions necessary to list and get Cloud Composer environments and operations. Provides read-only access to objects in all project buckets.	<code>composer.environments.get</code> <code>composer.environments.list</code> <code>composer.imageversions.*</code> <code>composer.operations.get</code> <code>composer.operations.list</code> <code>resourcemanager.projects.environments</code> <code>resourcemanager.projects.and</code> <code>operations.serviceusage.quotas.get</code> <code>serviceusage.services.get</code> <code>serviceusage.services.list</code> <code>storage.objects.get</code> <code>storage.objects.list</code>
<code>roles/composer.user</code>	Composer User	Provides the permissions necessary to list and get Cloud Composer environments and operations.	<code>composer.environments.get</code> <code>composer.environments.list</code> <code>composer.imageversions.*</code> <code>composer.operations.get</code> <code>composer.operations.list</code> <code>serviceusage.quotas.get</code> <code>environments</code> <code>serviceusage.services.get</code> <code>and</code> <code>serviceusage.services.list</code> <code>operations.</code>
<code>roles/composer.worker</code>	Composer Worker	Provides the permissions necessary to run a Cloud Composer environment	<code>artifactregistry.*</code> <code>cloudbuild.*</code> <code>container.*</code> <code>containeranalysis.occurrencer</code> <code>containeranalysis.occurrencer</code> <code>containeranalysis.occurrencer</code>

Role	Title	Description	Permissions
	VM. Intended for service accounts.		containeranalysis.occurrenc containeranalysis.occurrenc logging.logEntries.create monitoring.metricDescript monitoring.metricDescript monitoring.metricDescript monitoring. monitoredResourceDesc monitoring.timeSeries.* pubsub.snapshots.create pubsub.snapshots.delete pubsub.snapshots.get pubsub.snapshots.list pubsub.snapshots.seek pubsub.snapshots.update pubsub.subscriptions.con pubsub.subscriptions.crea pubsub.subscriptions.dele pubsub.subscriptions.get pubsub.subscriptions.list pubsub.subscriptions.upd pubsub.topics.attachSubs pubsub.topics.create pubsub.topics.delete pubsub.topics.detachSubs pubsub.topics.get pubsub.topics.list pubsub.topics.publish pubsub.topics.update pubsub.topics.updateTag remotebuildexecution.blob resourceanager.projects. resourceanager.projects. serviceusage.quotas.get serviceusage.services.get serviceusage.services.list source.repos.get source.repos.list storage.buckets.create storage.buckets.get storage.buckets.list storage.objects.*

Primitive roles

Role	Title	Description	Permissions	Lowest Resource
<code>roles/owner</code>	Owner	Primitive role that allows full control of Cloud Composer resources.	composer.operations.list composer.operations.get composer.operations.delete composer.environments.list composer.environments.get composer.environments.delete composer.environments.update composer.environments.create iam.serviceAccounts.actAs	Project
<code>roles/editor</code>	Editor	Primitive role that allows full control of Cloud Composer resources.	composer.operations.list composer.operations.get composer.operations.delete composer.environments.list composer.environments.get composer.environments.delete composer.environments.update composer.environments.create iam.serviceAccounts.actAs	Project
<code>roles/reader</code>	Viewer	Primitive role that allows a user to list and get Cloud Composer resources.	composer.operations.list composer.operations.get composer.environments.list composer.environments.get	Project

The primitive roles **Owner**, **Editor**, and **Viewer** include permissions for other Google Cloud services, as well.

Permissions for common tasks

Roles are a collection of permissions. This section lists the roles or permissions required for common tasks.

Task	Permissions and/or roles
Access the IAP-protected Airflow web interface	composer.environments.get

Run Airflow CLI using the `gcloud` command-line tool	<code>composer.environments.get</code> <code>container.clusters.getCredentials</code> <code>roles/container.developer</code>
View the Environments page in the Cloud Console	<code>composer.environments.list</code> <code>servicemanagement.projectSettings.get</code> (<code>/service-management/access-control#iam_permissions</code>)
View Google Cloud's operations suite logs and metrics	<code>roles/logging.viewer</code> (<code>/logging/docs/access-control#permissions_and_roles</code>) <code>roles/monitoring.viewer</code> (<code>/monitoring/access-control#predefined_roles</code>)
Create an environment	<code>composer.environments.create</code> <code>iam.serviceAccounts.actAs</code> (on the service account under which the environment will run)
Update and delete an environment, including setting environment variables and installing/updating Python packages	<code>environments.delete</code> <code>environments.update</code>
Upload files to the DAGs and Plugins folders and access Airflow logs in the Logs folder	<code>storage.objectAdmin</code> (<code>/storage/docs/access-control/iam-roles</code>) assigned at the bucket or the project level <code>composer.environments.get</code> to look up the DAG destination bucket

Access control via `gcloud`

To assign predefined roles, execute the `gcloud projects get-iam-policy` (`/sdk/gcloud/reference/projects/get-iam-policy`) command to get the current policy, update the policy binding with either the `roles/composer.admin` (Composer Administrator) role or the `roles/composer.user` (Composer User) role, and then execute the `gcloud projects set-iam-policy` (`/sdk/gcloud/reference/projects/set-iam-policy`) command. See the [Granting, Changing, and Revoking Access to Resources](#) (`/iam/docs/granting-changing-revoking-access`) page of the IAM documentation for more information about assigning roles using `gcloud`.

To configure a custom role with Cloud Composer permissions, execute the `gcloud iam roles create` (/sdk/gcloud/reference/iam/roles/create) command, including the desired list of permissions from the `roles table` (#roles). Then, update the IAM policy with the newly configured custom role. See the [Creating a custom role](/iam/docs/creating-custom-roles#creating_a_custom_role) (/iam/docs/creating-custom-roles#creating_a_custom_role) page in the IAM documentation for more information.

Access control via the Cloud Console

You can use the Cloud Console to manage access control for your environments and projects.

To set access controls at the project level:

1. Open the [IAM page](https://console.cloud.google.com/project/_/iam-admin/iam) (https://console.cloud.google.com/project/_/iam-admin/iam) in the Google Cloud Console.
2. Select your project, and click **Continue**.
3. Click **Add Member**.
4. Enter the email address of a new member to whom you have not granted any IAM role previously.
5. Select the desired role from the drop-down menu.
6. Click **Add**.
7. Verify that the member is listed under the role that you granted.
