## Dataprep by Trifacta Pricing

Dataprep is an interactive web application in which users define the data preparation rules by interacting with a sample of their data. Use of the application is free. Once a data preparation flow has been defined, the sample can be exported for free or the flow can be executed as a Dataprep job (using <u>Dataflow</u> (/dataflow)) over the original dataset.

## Pricing

When you submit a job to Dataprep, it is executed by <u>Dataflow</u> (/dataflow) workers. Dataprep is billed according to the number of Dataflow worker virtual CPUs (vCPUs) that are needed to process a job and the time that the vCPUs are used multiplied by the Dataprep service rate of \$0.60 per hour.

The Dataprep service is available in each of the <u>Dataflow regions</u> (/dataflow/docs/concepts/regional-endpoints).

**Example:** A Dataprep job runs for 1 hour and requires 5 Dataflow virtual CPUs.

Dataprep job cost = 1 hour \* \$0.60 \* 5 vCPUs = \$3.00

mber of workers and job duration depend on how Dataflow is configured.

While the rate for pricing is per-hour, Dataprep service usage is billed in per-second increments on a per-job bas

The use of Dataprep to define flows is free of charge.

The use of other resources in a job, such as BigQuery or Cloud Storage, are billed separately at their pricing.

Refer to the <u>Dataflow documentation</u> (/dataflow/docs) and the <u>Google Cloud Platform Pricing Calculator</u> (/products/calculator) to estimate costs for Dataprep jobs.
