

This page describes how to manage your Anthos GKE deployed on-prem clusters.

1. SSH into your admin workstation:

2. Log in to Google Cloud using your account credentials:

3. Set a default project. Setting a default Google Cloud causes all Cloud SDK commands to run against the project, so that you don't need to specify your project for each command:

Replace **[PROJECT_ID]** with your project ID

(/resource-manager/docs/creating-managing-projects). (You can find your project ID in Cloud Console, or by running `gcloud config get-value project`.)

If you want to connect to your clusters, you have two options:

- You can [SSH into cluster nodes](/gke-on-prem/docs/how-to/ssh-cluster-node) (/gke-on-prem/docs/how-to/ssh-cluster-node).
- If you registered your clusters with Google Cloud, you can [log in to clusters from Cloud Console](/anthos/multicluster-management/console/logging-in) (/anthos/multicluster-management/console/logging-in).
