# Choosing between Cloud Tasks and Pub/Sub

- [Contents](#)
- [Access and authentication](#)
- [Key Differences](#)
  - [Authentication](#)
  - [Detailed feature comparison](#)
  - [Access control](#)

Both [Operations and administration](#) [Cloud Tasks](#) and [Pub/Sub](#) can be used to implement message passing and asynchronous integration. Although they are conceptually similar, each is designed for different set of use cases. This page helps you choose the right product for your use case.

## Key Differences

- [Working with audit logs](#)
- [Reporting usage with labels](#)
- [Using customer-managed encryption keys](#)
- [Restricting resource locations](#)

The core difference between [Pub/Sub](#) and [Cloud Tasks](#) is in the notion of implicit vs. explicit invocation.

[Pub/Sub](#) aims to decouple publishers of events and subscribers to those events. Publishers do not need to know anything about their subscribers. Therefore, [Pub/Sub](#) gives publishers no control over the delivery of the messages save for the guarantee of delivery. In this way, [Pub/Sub](#) supports **implicit** invocation; a publisher implicitly causes the subscribers to execute by publishing an event.

By contrast, [Cloud Tasks](#) is aimed at **explicit** invocation where the publisher retains full control of execution. In particular, a publisher specifies an endpoint where each message is to be delivered.

  - [.NET](#)
- [All concepts](#)
- [What's Cloud Pub/Sub?](#)
- [Architectural overview](#)
- [Cloud Tasks or Cloud Pub/Sub?](#)
- [All tutorials](#)

Overall Cloud Tasks are appropriate for use cases where a task producer needs to defer or control the execution timing of a specific webhook or remote procedure call. Pub/Sub is optimal for more general event data ingestion and distribution patterns where some degree of control over execution can be sacrificed.

- Node.js
- PHP
- Python
- Ruby

## Detailed feature comparison

Feature	Cloud Tasks	Cloud Pub/Sub
Push via webhooks	Yes	Yes
At least once delivery guarantee	Yes	Yes
Task deduplication	Yes	No
Configurable retries	Yes	No
Scheduled delivery	Yes	No
Explicit rate controls	Yes	No (Subscriber clients can implement <a href="#">flow control</a> )
Push via API client libraries	No	Yes
Batch insert	No	Yes
Multiple handlers/subscribers per message	No	Yes
Task/message retention	30 days	Up to 7 days
Max size of task/message	100KB	10MB
Max publishing messages	500 qps/queue	No upper limit
Geographic availability	Regional	Global
Maximum push handler/subscriber duration	30 minutes (HTTP) 10 minutes (App Engine Standard automatic scaling) 24 hours (App Engine Standard manual or basic scaling)	10 minutes for push operations
Access and authentication	60 minutes (App Engine Flexible)	
Number of queues/subscriptions per project	1,000/project, more available via quota increase request	10,000/project
