

This page describes tips, troubleshooting, and known issues that you might find helpful if you run into problems using Cloud Source Repositories.

It can take several hours for a newly added repository or large commit to be indexed for search. Please try again after a few hours. If no changes have been made in the last 24 hours or if this issue persists for over 24 hours, please contact [support](/support) (/support).

Cloud Source Repositories uses Cloud Identity and Access Management to grant permissions to users. If a user cannot perform a specific action, such as create a new repository, check to ensure they have the correct IAM permissions. To learn more about these permissions, see [Configuring Access to Repositories](/source-repositories/docs/configure-access-control) (/source-repositories/docs/configure-access-control).

For example, if a user has the `source.repos.read` permission to a repository, but does not have the `source.repos.list` permission on the project, the user cannot see the repository in the Repository view.

You can resolve this issue by granting the `source.repos.list` permission to the user on the project. Alternatively, the user can also access the repository through a direct hyperlink; however, the user will not be able to search the repository without being granted the `source.repos.list` permission on the project.

If you just created a project, it can take a few minutes for the project information to update. Wait 10 minutes and refresh your browser. If the problem persists, please contact [support](/support) (/support).

It can take a few minutes for deleted content to get removed from the user interface. Refreshing your browser should resolve this issue.

Cloud Source Repositories only displays the most recent commits during searches. To find older commits, use the [History panel](#) (/source-repositories/docs/viewing-commit-changes#using_the_change_history_panel).
