Managing replicas

MySQL | [PostgreSQL](https://cloud.google.com/sql/docs/postgres/replication/manage-replicas) (<https://cloud.google.com/sql/docs/postgres/replication/manage-replicas>) | [SQL Server](#)

This page describes how you can disable and enable replication for a read replica, as well as how to promote a replica to a stand-alone instance or delete it. For information about working with read replicas, see [Requirements and Tips for Configuring Replication](https://cloud.google.com/sql/docs/mysql/replication/tips) (<https://cloud.google.com/sql/docs/mysql/replication/tips>).

Disabling replication

By default, a replica starts with replication enabled. However, you can disable replication, for example, to debug or analyze the state of an instance. When you are ready, you explicitly reenabling replication. Disabling or reenabling replication restarts the replica.

Disabling replication does not stop the replica instance; it becomes a read-only instance that is no longer replicating from its master instance. You continue to be charged for the instance. You can reenabling replication on the disabled replica, delete the replica, or promote the replica to a stand-alone instance. You cannot stop the replica.

To disable replication:

CONSOLE

G-CLOUD

CURL

1. Go to the Cloud SQL Instances page in the Google Cloud Console.

[GO TO THE CLOUD SQL INSTANCES PAGE](https://console.cloud.google.com/sql/instances) ([HTTPS://CONSOLE.CLOUD.GOOGLE.COM/SQL/INSTANCES](https://console.cloud.google.com/sql/instances))

2. Open a replica instance by clicking its name.
3. Click **Disable replication** in the button bar.
4. Click **OK**.

Enabling replication

If a replica has not been replicating for a long time, it will take longer for it to catch up to the master. In this case, you should delete the replica and create a new one.

To enable replication:

CONSOLE	G CLOUD	CURL
<ol style="list-style-type: none">1. Go to the Cloud SQL Instances page in the Google Cloud Console. GO TO THE CLOUD SQL INSTANCES PAGE (HTTPS://CONSOLE.CLOUD.GOOGLE.COM/SQL/INSTANCES)2. Select a replica instance by clicking its name.3. Click Enable replication in the button bar.4. Click OK.		

Promoting a replica

Promoting a replica to a stand-alone Cloud SQL instance is an irreversible action. Once promoted, an instance cannot be converted back to a read replica.

To promote a replica to a stand-alone instance:

CONSOLE	G CLOUD	CURL
<ol style="list-style-type: none">1. Go to the Cloud SQL Instances page in the Google Cloud Console. GO TO THE CLOUD SQL INSTANCES PAGE (HTTPS://CONSOLE.CLOUD.GOOGLE.COM/SQL/INSTANCES)2. Select a replica instance by clicking its name.3. Click Promote replica in the button bar.4. Click OK.		

Confirm that the promoted instance is configured correctly. In particular, you should enable automated backups

(<https://cloud.google.com/sql/docs/mysql/backup-recovery/backing-up#schedulebackups>) and consider

[configuring the instance for high availability](#).

(<https://cloud.google.com/sql/docs/configure-ha#ha-existing>) if needed.

Checking replication status

When you log into an individual replica instance using an administration client, you get details about replication, including status and metrics. When you use the Google Cloud Console or the `gcloud` command-line tool, you get a brief summary of replication.

Note: You cannot check replication status using the Google Cloud Console for a replica that has a master instance external to Cloud SQL.

To check replication status:

CONSOLE	GCLOUD	MYSQL CLIENT
<ol style="list-style-type: none">1. Go to the Cloud SQL Instances page in the Google Cloud Console. GO TO THE CLOUD SQL INSTANCES PAGE (HTTPS://CONSOLE.CLOUD.GOOGLE.COM/SQL/INSTANCES)2. Select a replica instance by clicking its name.3. The replication status is provided in a banner at the top of the page.
