

This page shows you how to create Cloud Storage buckets. For an overview of buckets, read the [Key Terms](/storage/docs/key-terms#buckets) (/storage/docs/key-terms#buckets). If not otherwise specified in your request, buckets are created in the [US multi-region](/storage/docs/locations) (/storage/docs/locations) and have a default storage class of [Standard Storage](/storage/docs/storage-classes#standard) (/storage/docs/storage-classes#standard).

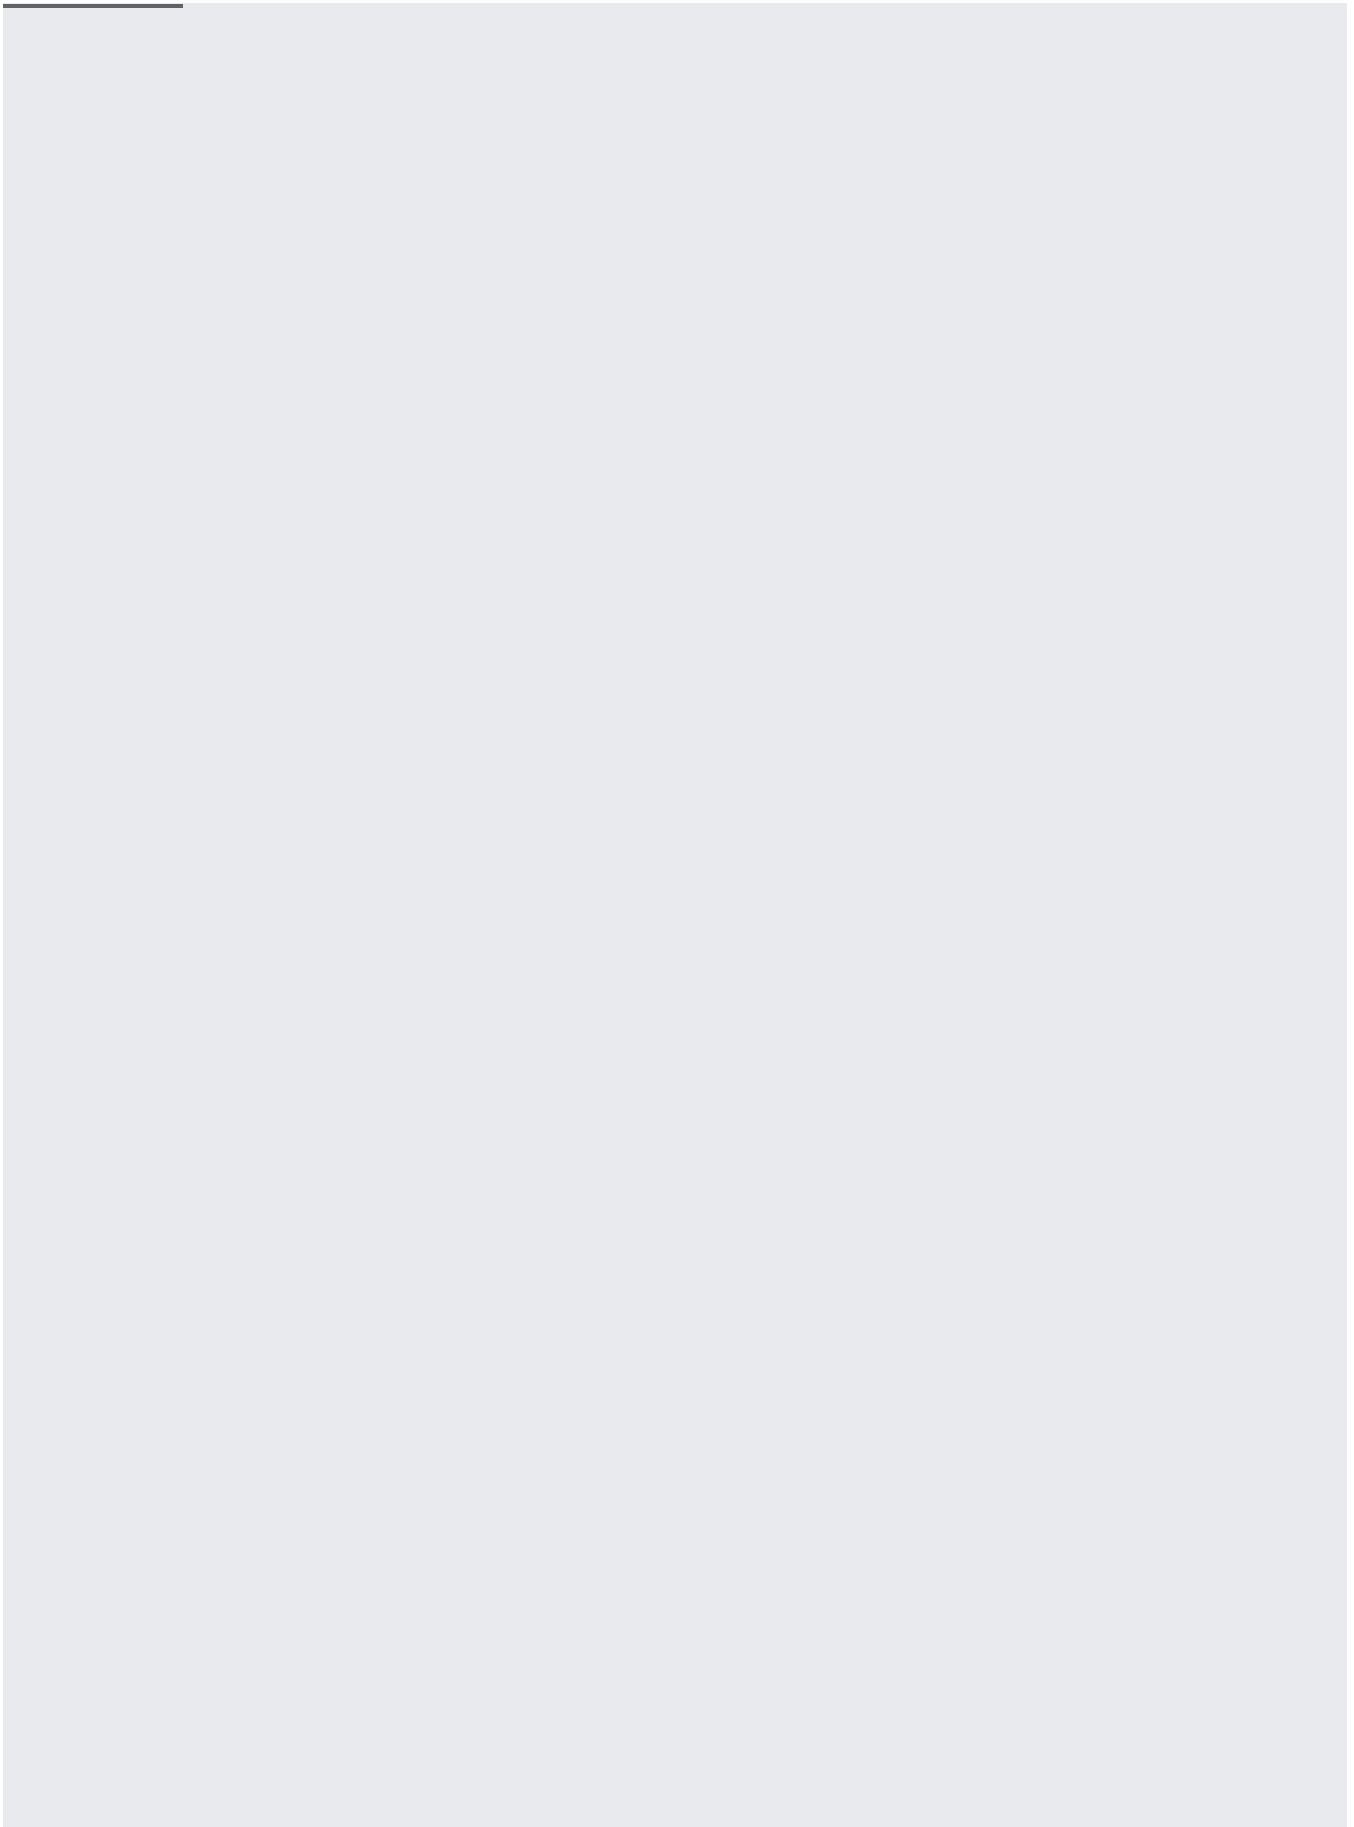

In order to create a bucket in a project, a user must have the `storage.objects.create` [project permission](/storage/docs/access-control/iam) (/storage/docs/access-control/iam) for the project. If you are working within a project that you did not create, you might need to ask the project owner to [give you a role](/storage/docs/access-control/using-iam-permissions#project-add) (/storage/docs/access-control/using-iam-permissions#project-add) that contains this permission, such as **Editor**, **Owner**, or **Storage Admin**.

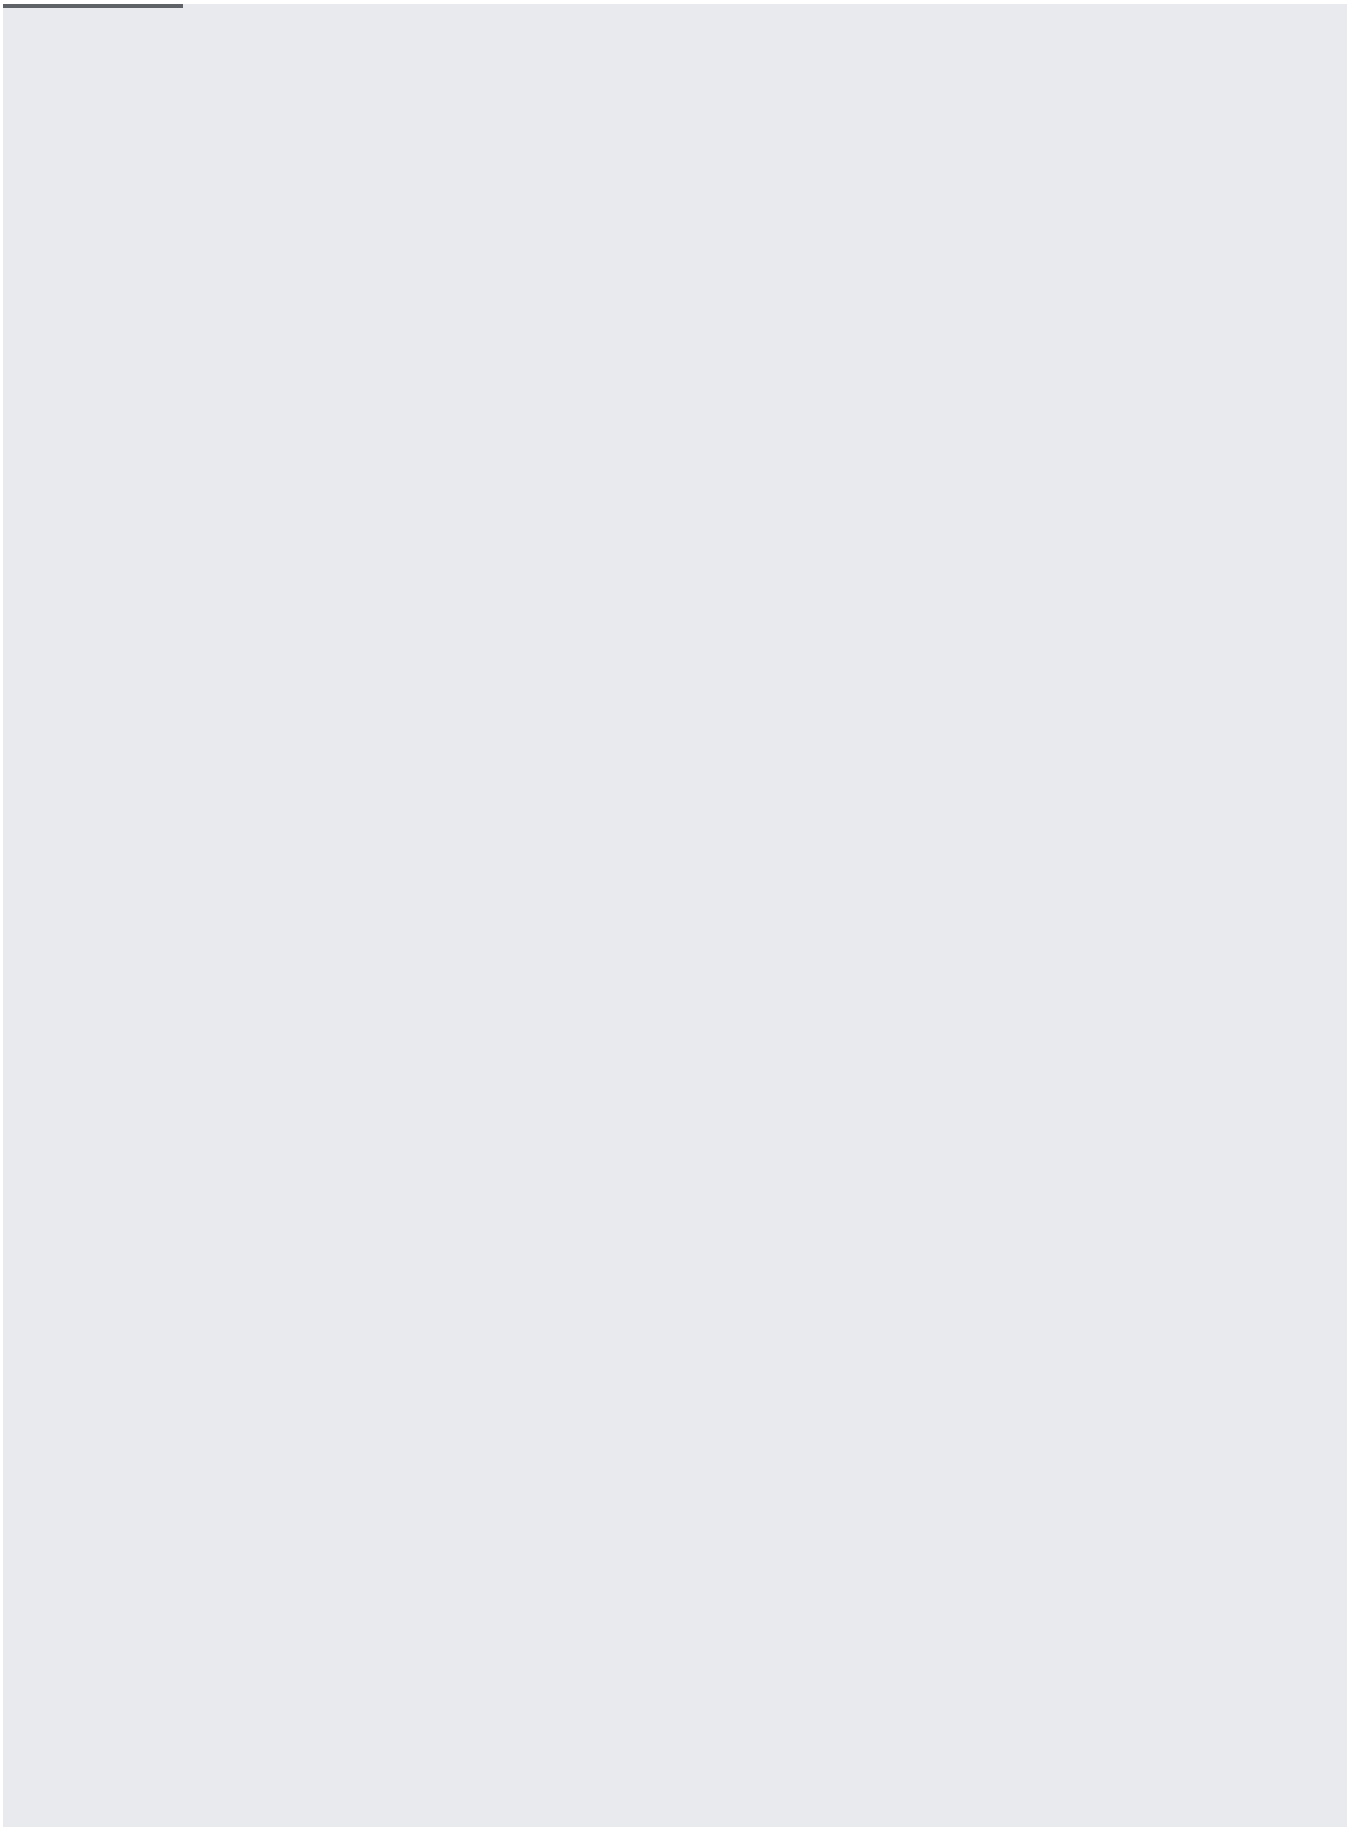

To create a new storage bucket:

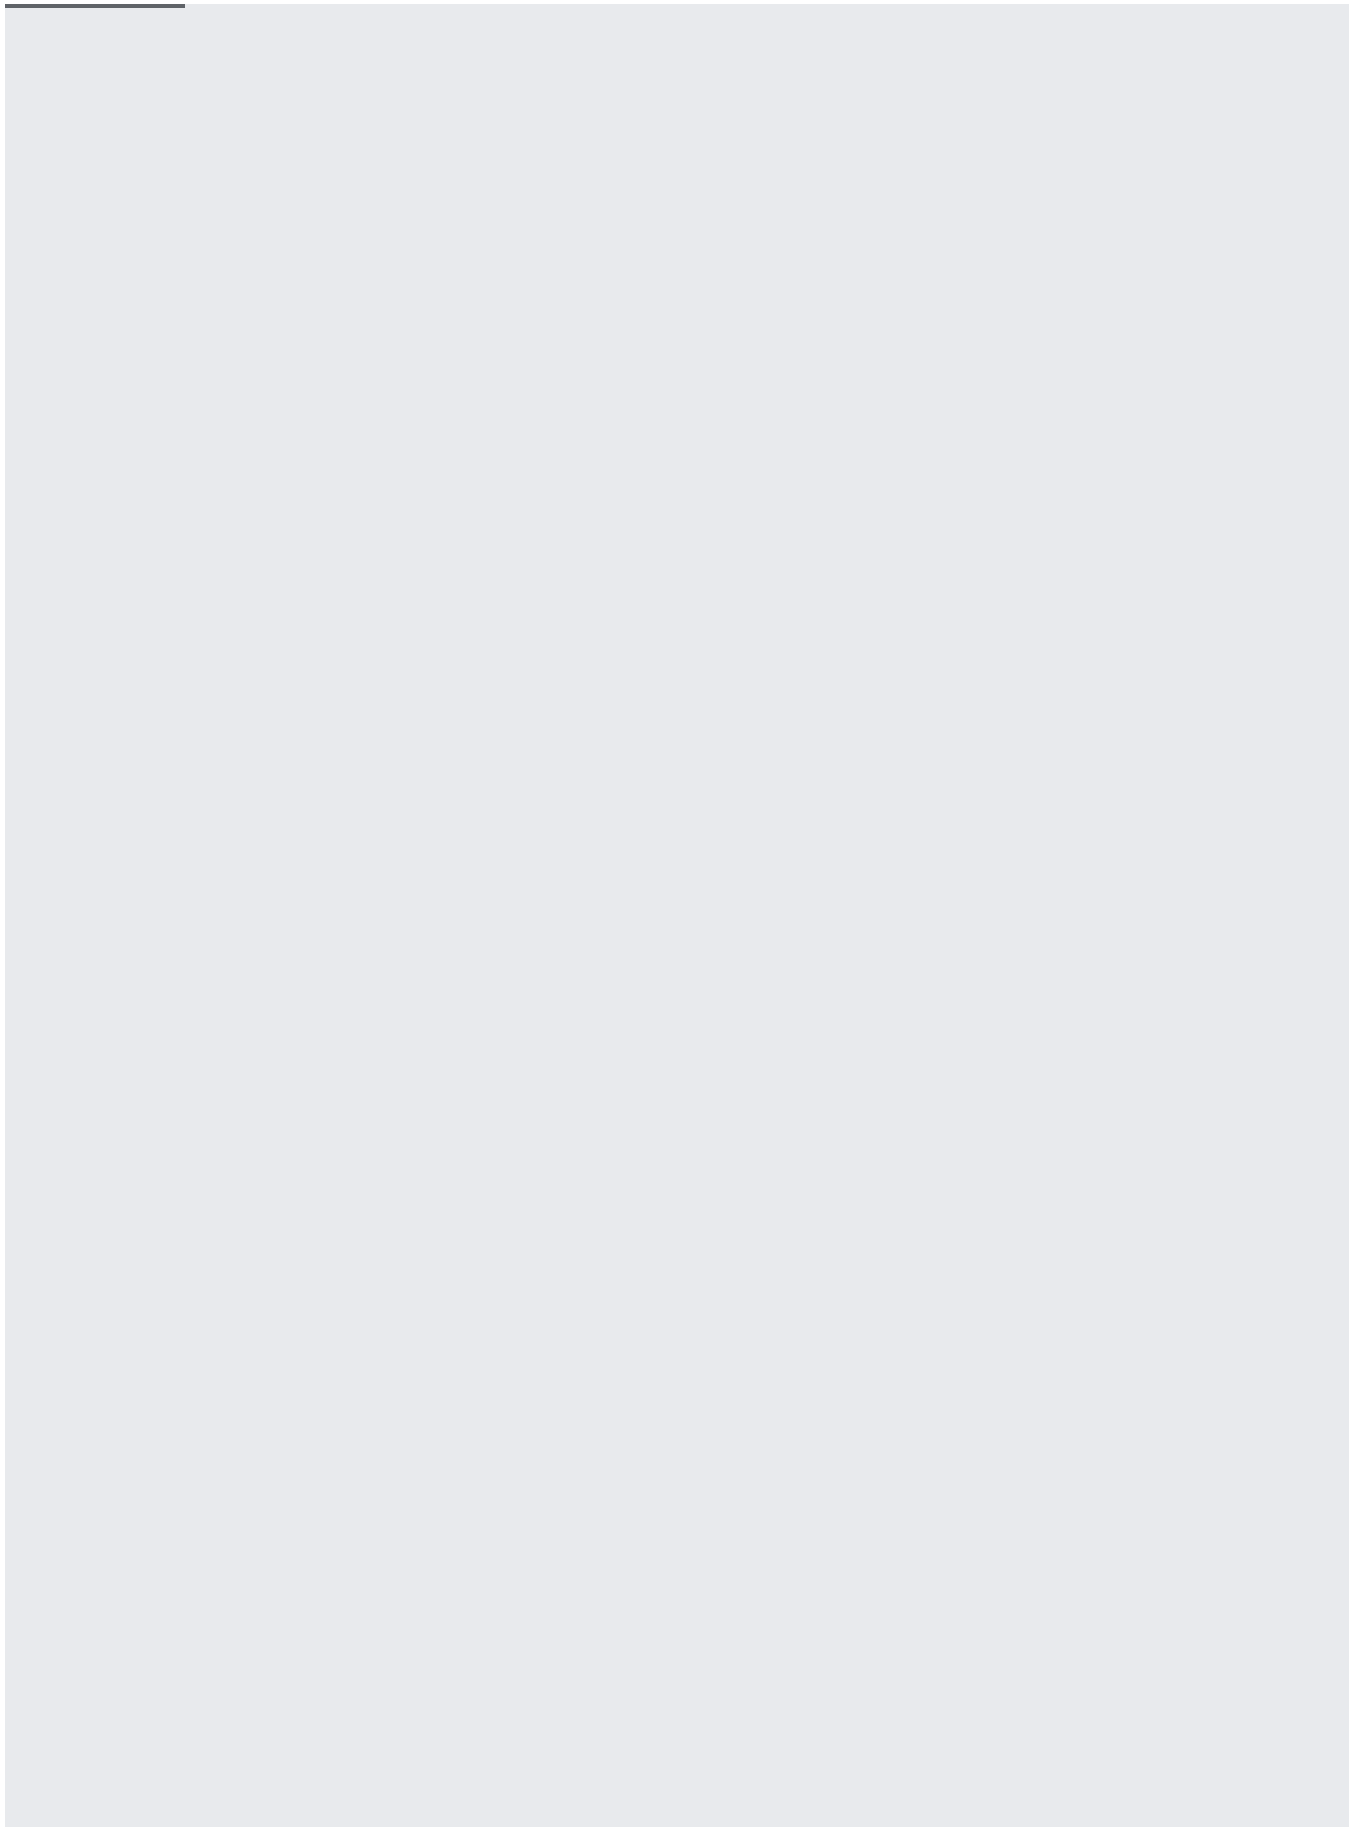

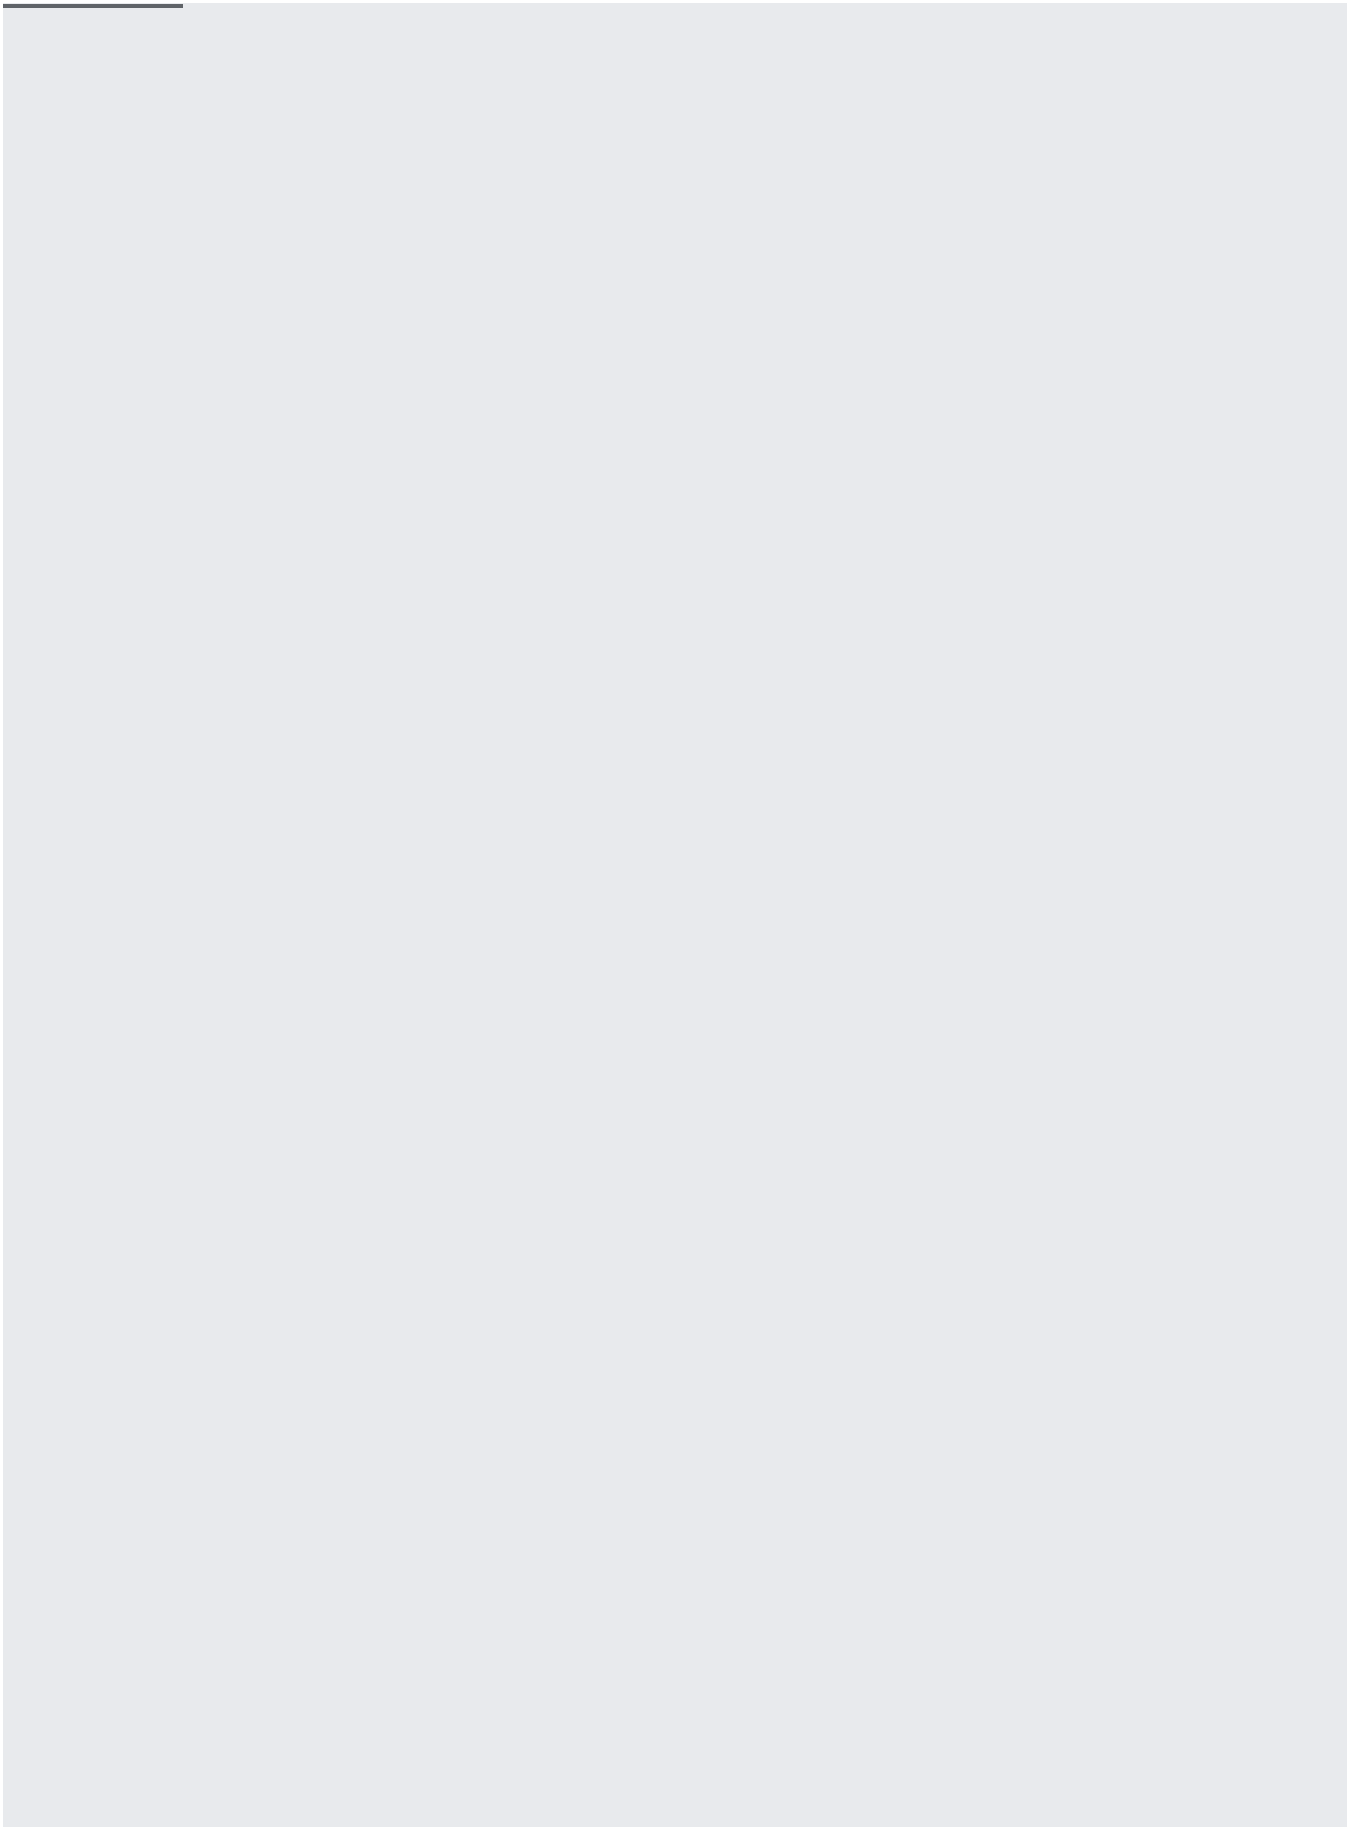

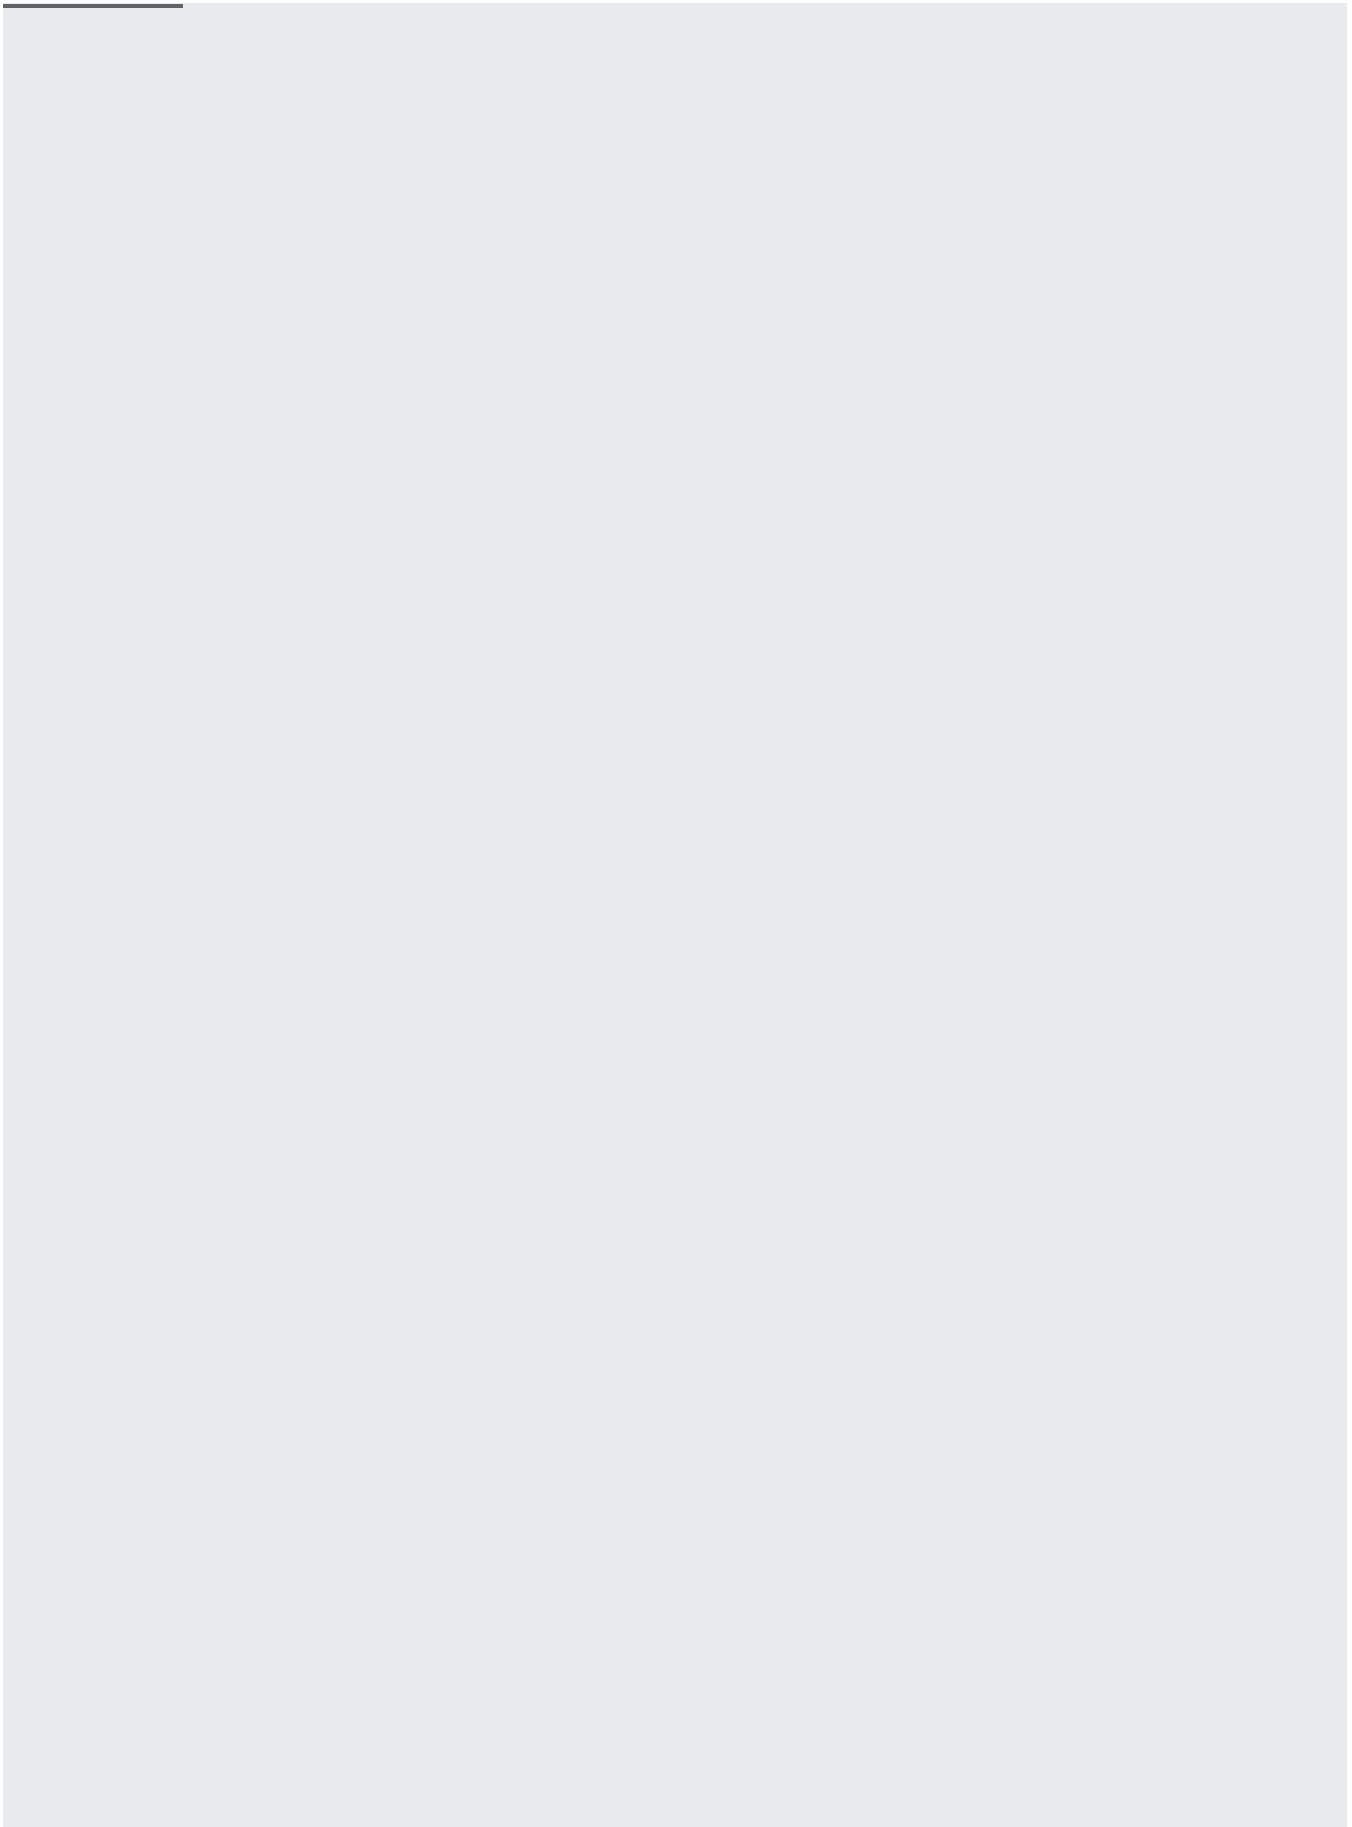

- [List buckets in a project](/storage/docs/listing-buckets) (/storage/docs/listing-buckets).
- [Get bucket information](/storage/docs/getting-bucket-information) (/storage/docs/getting-bucket-information).
- [Move or rename a bucket](/storage/docs/moving-buckets) (/storage/docs/moving-buckets).
- [Delete a bucket](/storage/docs/deleting-buckets) (/storage/docs/deleting-buckets).
- [Upload an object to your bucket](/storage/docs/uploading-objects) (/storage/docs/uploading-objects).
- [Learn the basics of using Cloud Storage with the Google Cloud Console](/storage/docs/quickstart-console) (/storage/docs/quickstart-console).
