

## Profile Search (Beta)

This is a closed beta release of Profile Search (Beta).

Cloud Talent Solution - Profile Search (Beta) is a service that leverages machine learning to return candidate profiles in response to a search query. Profile Search (Beta) yields better results than those provided by keyword-based methods because it automatically detects and infers various kinds of data, such as related titles, seniority, and industry. Similarly, Profile Search (Beta) detects and infers the intent of recruiter queries, matching intent with the skill set and interests of job seekers.

Profile Search (Beta) is a RESTful API with client libraries available in several languages. The client libraries provide you with the correct structure to generate the underlying HTTP requests and also abstract away the intricacies of OAuth2.0 authentication. Alternately, you can make direct HTTP requests using tools such as cURL, by leveraging the Google OAuth2.0 token generation tool.
