

This document describes how to use the Cloud Translation - Advanced to detect the language of a string.

See [Migrating to Translation Advanced \(/translation/docs/migrate-to-v3\)](/translation/docs/migrate-to-v3) for details regarding differences between Advanced.

You can detect the language of a text string by sending an HTTP request using a URL of the following format:

***project-id*** works as well, but ***project-number*** is preferred going forward.
