Some methods of the Video Intelligence API return a long-running operation. These methods are asynchronous, and the operation may not be completed when the method returns a response.

You can check the status of a long-running task (importing items into a dataset (/video-intelligence/automl/docs/datasets#import-data) or training a model (#train)) using the operation name.

When using the Web UI you can monitor the status in the **Status** column of the list page.

You can only check the status of operations using the AutoML API.

You can cancel a long-running operation using the operation name. The cancellation is not guaranteed to succeed.
