

[Cloud AutoML Vision](#)

# Method: projects.locations.models.deploy

Deploys a model. If a model is already deployed, deploying it with the same parameters has no effect. Deploying with different parameters (as e.g. changing [node\\_number](#) ([https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/google.cloud.automl.v1beta1.ImageObjectDetectionModelDeploymentMetadata.node\\_number](https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/google.cloud.automl.v1beta1.ImageObjectDetectionModelDeploymentMetadata.node_number)) ) will reset the deployment state without pausing the model's availability.

Only applicable for Image Object Detection and Image Classification; all other domains manage deployment automatically.

Returns an empty response in the [response](#)

(<https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.operations#Operation.FIELDS.response>)

field when it completes.

## HTTP request

POST <https://automl.googleapis.com/v1beta1/{name}:deploy>

## Path parameters

Parameters	
<b>name</b>	<b>string</b> Resource name of the model to deploy. Authorization requires the following <a href="#">Google IAM</a> ( <a href="https://cloud.google.com/iam">https://cloud.google.com/iam</a> ) permission on the specified resource name: <ul style="list-style-type: none"><li><code>automl.models.deploy</code></li></ul>

## Request body

The request body contains data with the following structure:

## JSON representation

```
{
  // Union field model_deployment_metadata can be only one of the following:
  "imageObjectDetectionModelDeploymentMetadata": {
    object (ImageObjectDetectionModelDeploymentMetadata (https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageObjectDetectionModelDeploymentMetadata))
  },
  "imageClassificationModelDeploymentMetadata": {
    object (ImageClassificationModelDeploymentMetadata (https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageClassificationModelDeploymentMetadata))
  },
  // End of list of possible types for union field model_deployment_metadata.
}
```

## Fields

Union field `model_deployment_metadata`. The per-domain specific deployment parameters.

`model_deployment_metadata` can be only one of the following:

<code>imageObjectDetectionModelDeploymentMetadata</code>	<pre>object (<a href="https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageObjectDetectionModelDeploymentMetadata">ImageObjectDetectionModelDeploymentMetadata</a> (https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageObjectDetectionModelDeploymentMetadata))</pre> <p>Model deployment metadata specific to Image Object Detection.</p>
<code>imageClassificationModelDeploymentMetadata</code>	<pre>object (<a href="https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageClassificationModelDeploymentMetadata">ImageClassificationModelDeploymentMetadata</a> (https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models/deploy#ImageClassificationModelDeploymentMetadata))</pre> <p>Model deployment metadata specific to Image Classification.</p>

## Response body

If successful, the response body contains an instance of `Operation`

(<https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.operations#Operation>)

## Authorization Scopes

Requires the following OAuth scope:

- <https://www.googleapis.com/auth/cloud-platform>

For more information, see the [Authentication Overview](#)

(<https://cloud.google.com/docs/authentication/>).

## ImageObjectDetectionModelDeploymentMetadata

Model deployment metadata specific to Image Object Detection.

### JSON representation

```
{
  "nodeCount": string
}
```

### Fields

<b>nodeCount</b>	<b>string</b> ( <a href="https://developers.google.com/discovery/v1/type-formats">int64</a> ) Input only. The number of nodes to deploy the model on. A node is an abstract unit of computation. For more information, see <a href="https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models.deploy">https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models.deploy</a> . Must be between 1 and 100, inclusive on both ends.
------------------	--

## ImageClassificationModelDeploymentMetadata

Model deployment metadata specific to Image Classification.

### JSON representation

```
{
  "nodeCount": string
}
```

## Fields

### nodeCount

**string** ([int64](https://developers.google.com/discovery/v1/type-format))

(<https://developers.google.com/discovery/v1/type-format>) **format**)

Input only. The number of nodes to deploy the model on. A node is an abstraction of a machine resource, which can handle online prediction QPS as given in the model's

[nodeQps](https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models#ImageClassificationModelMetadata.FIELDS.node_qps)

([https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models#ImageClassificationModelMetadata.FIELDS.node\\_qps](https://cloud.google.com/vision/automl/docs/reference/rest/v1beta1/projects.locations.models#ImageClassificationModelMetadata.FIELDS.node_qps))

. Must be between 1 and 100, inclusive on both ends.
