[Cloud Vision API](https://cloud.google.com/vision/) (<https://cloud.google.com/vision/>)

[Documentation](https://cloud.google.com/vision/docs/) (<https://cloud.google.com/vision/docs/>) [Guides](#)

Detect handwriting in images

Note:

- We've recently added new features or fields to **DOCUMENT_TEXT_DETECTION**. See the [release notes](https://cloud.google.com/vision/docs/release-notes#march2018) (<https://cloud.google.com/vision/docs/release-notes#march2018>) for details.
- Using this API in a mobile app? Try [ML Kit for Firebase](https://firebase.google.com/docs/ml-kit/) (<https://firebase.google.com/docs/ml-kit/>), which provides native Android and iOS SDKs for using Cloud Vision services, as well as on-device ML Vision APIs and on-device inference using custom ML models.
- Cloud Vision now supports offline **asynchronous batch image annotation** for all features. This asynchronous request supports up to 2000 image files and returns response JSON files that are stored in your Cloud Storage bucket. For more information about this feature, refer to [Offline batch image annotation](https://cloud.google.com/vision/docs/batch) (<https://cloud.google.com/vision/docs/batch>).

Pricing for document text detection is at the **DOCUMENT_TEXT_DETECTION** rate. Please see the [Pricing](https://cloud.google.com/vision/pricing) (<https://cloud.google.com/vision/pricing>) page for details.

Handwriting detection with Optical Character Recognition (OCR)

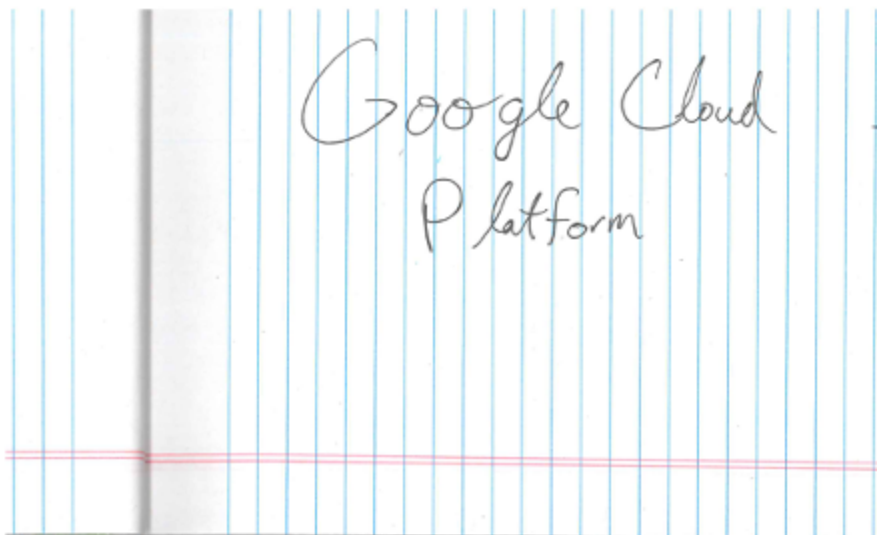

The Vision API can detect and extract text from images:

- **DOCUMENT_TEXT_DETECTION** extracts text from an image (or [file](https://cloud.google.com/vision/docs/pdf) (<https://cloud.google.com/vision/docs/pdf>)); the response is **optimized for dense text and documents**. The JSON includes page, block, paragraph, word, and break information.

One specific use of DOCUMENT_TEXT_DETECTION

(<https://cloud.google.com/vision/docs/ocr>) is to detect handwriting in an image.

Document text detection requests

Set up your GCP project and authentication

- ▼ If you have not created a Google Cloud Platform (GCP) project (<https://cloud.google.com/docs/overview/#projects>) and service account credentials, do so

now. Expand this section for instructions.

1. [Sign in](https://accounts.google.com/Login) (https://accounts.google.com/Login) to your Google Account.

If you don't already have one, [sign up for a new account](https://accounts.google.com/SignUp) (https://accounts.google.com/SignUp).

2. Set up a Cloud Console project.

SET UP A PROJECT

Click to:

- Create or select a project.
- Enable the Cloud Vision API for that project.
- Create a service account.
- Download a private key as JSON.

You can view and manage these resources at any time in the [Cloud Console](https://console.cloud.google.com/) (https://console.cloud.google.com/).

3. Set the environment variable **GOOGLE_APPLICATION_CREDENTIALS** to the file path of the JSON file that contains your service account key. This variable only applies to your current shell session, so if you open a new session, set the variable again.

▼ **Example:** Linux or macOS

Replace **[PATH]** with the file path of the JSON file that contains your service account key.

```
export GOOGLE_APPLICATION_CREDENTIALS="[PATH]"
```

For example:

```
export GOOGLE_APPLICATION_CREDENTIALS="/home/user/Downloads/service-account-file"
```

▼ **Example:** Windows

Replace **[PATH]** with the file path of the JSON file that contains your service account key, and **[FILE_NAME]** with the filename.

With PowerShell:

```
$env:GOOGLE_APPLICATION_CREDENTIALS="[PATH]"
```

For example:

```
$env:GOOGLE_APPLICATION_CREDENTIALS="C:\Users\username\Downloads\[FILE_NAME].json"
```

With command prompt:

```
set GOOGLE_APPLICATION_CREDENTIALS=[PATH]
```

4. Install and initialize the Cloud SDK (<https://cloud.google.com/sdk/docs/>).

Detect document text in a local image

The Vision API can perform feature detection on a local image file by sending the contents of the image file as a base64 encoded (<https://cloud.google.com/vision/docs/base64>) string in the body of your request.

REST & CMD LINE

C#

GO

MORE ▾

Before using any of the request data below, make the following replacements:

- **base64-encoded-image**: The base64 representation (ASCII string) of your binary image data. This string should look similar to the following string:

- `/9j/4QAYRXhpZgAA...9tAVx/zDQD1Gxn//2Q==`

Visit the base64 encode (<https://cloud.google.com/vision/docs/base64>) topic for more information.

HTTP method and URL:

```
POST https://vision.googleapis.com/v1/images:annotate
```

Request JSON body:

```
{
  "requests": [
    {
      "image": {
        "content": "base64-encoded-image"
      },
      "features": [
        {
          "type": "DOCUMENT_TEXT_DETECTION"
        }
      ]
    }
  ]
}
```

```
]
}
```

To send your request, choose one of these options:

CURL

POWERSHELL

Note: If you are not executing the command below from [Cloud Shell](https://cloud.google.com/shell/docs) (<https://cloud.google.com/shell/docs>) or [Compute Engine](https://cloud.google.com/compute/docs) (<https://cloud.google.com/compute/docs>), ensure you have set the [GOOGLE_APPLICATION_CREDENTIALS](https://cloud.google.com/docs/authentication/production) (<https://cloud.google.com/docs/authentication/production>) environment variable to your service account private key file path.

Save the request body in a file called `request.json`, and execute the following command:

```
curl -X POST \
-H "Authorization: Bearer "$(gcloud auth application-default print-access-token)
-H "Content-Type: application/json; charset=utf-8" \
-d @request.json \
https://vision.googleapis.com/v1/images:annotate
```

If the request is successful, the server returns a `200 OK` HTTP status code and the response in JSON format.

Note: Zero coordinate values omitted. When the API detects a coordinate ("x" or "y") value of 0, *that coordinate is omitted in the JSON response*. Thus, a response with a bounding poly around the entire image would be `[{"x": 100}, {"x": 100, "y": 100}, {"y": 100}]` for an image that is 100px by 100px. For more information, see the [API Reference documentation](https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly) (<https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly>).

Detect document text in a remote image

For your convenience, the Vision API can perform feature detection directly on an image file located in Google Cloud Storage or on the Web without the need to send the contents of the image file in the body of your request.

Caution: When fetching images from HTTP/HTTPS URLs, Google cannot guarantee that the request will be completed. Your request may fail if the specified host denies the request (for example, due to request throttling or [DOS \(https://en.wikipedia.org/wiki/Denial-of-service_attack\)](https://en.wikipedia.org/wiki/Denial-of-service_attack) prevention), or if Google throttles requests to the site for abuse prevention. **You should not depend on externally-hosted images for production applications.**

C#

MORE ▾

Before using any of the request data below, make the following replacements:

- **cloud-storage-image-uri:** the path to a valid image file in a Cloud Storage bucket. You must at least have read privileges to the file. Example:

- `gs://vision-api-handwriting-ocr-bucket/handwriting_image.png`

HTTP method and URL:

POST `https://vision.googleapis.com/v1/images:annotate`

Request JSON body:

```
{
  "requests": [
    {
      "image": {
        "source": {
          "imageUri": "cloud-storage-image-uri"
        }
      },
      "features": [
        {
          "type": "DOCUMENT_TEXT_DETECTION"
        }
      ]
    }
  ]
}
```

To send your request, choose one of these options:

CURL

POWERSHELL

Note: If you are not executing the command below from [Cloud Shell](https://cloud.google.com/shell/docs) (<https://cloud.google.com/shell/docs>) or [Compute Engine](https://cloud.google.com/compute/docs) (<https://cloud.google.com/compute/docs>), ensure you have set the [GOOGLE_APPLICATION_CREDENTIALS](https://cloud.google.com/docs/authentication/production) (<https://cloud.google.com/docs/authentication/production>) environment variable to your service account private key file path.

Save the request body in a file called `request.json`, and execute the following command:

```
curl -X POST \
-H "Authorization: Bearer "$(gcloud auth application-default print-access-token)
-H "Content-Type: application/json; charset=utf-8" \
-d @request.json \
https://vision.googleapis.com/v1/images:annotate
```

If the request is successful, the server returns a **200 OK** HTTP status code and the response in JSON format.

Note: Zero coordinate values omitted. When the API detects a coordinate ("x" or "y") value of 0, *that coordinate is omitted in the JSON response*. Thus, a response with a bounding poly around the entire image would be **[{},{"x": 100},{"x": 100,"y": 100},{"y": 100}]** for an image that is **100px by 100px**. For more information, see the [API Reference documentation](https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly) (<https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly>).

  }
},
],
"blockType": "TEXT"
}
],
"text": "Google Cloud Platform\n"
}
]
}

```

Specify the language (optional)

Both types of OCR requests support one or more `languageHints` that specify the language of any text in the image. However, in most cases, an empty value yields the best results since it enables automatic language detection. For languages based on the Latin alphabet, setting `languageHints` is not needed. In rare cases, when the language of the text in the image is known, setting a hint helps get better results (although it can be a significant hindrance if the hint is wrong). Text detection returns an error if one or more of the specified languages is not one of the [supported languages](https://cloud.google.com/vision/docs/languages) (<https://cloud.google.com/vision/docs/languages>).

If you choose to provide a language hint, modify the body of your request (`request.json` file) to provide the string of one of the supported languages in the `imageContext.languageHints` field as shown below:

```
{
  "requests": [
    {
      "image": {
        "source": {
          "imageUri": "image-url"
        }
      },
      "features": [
        {
          "type": "DOCUMENT_TEXT_DETECTION"
        }
      ],
      "imageContext": {
        "languageHints": ["en-t-i0-handwrit"]
      }
    }
  ]
}
```

How do language hints work?

The `languageHint` format follows the [BCP47](https://tools.ietf.org/html/bcp47) (<https://tools.ietf.org/html/bcp47>) language code formatting guidelines. The BCP47 specified format is as follows:

```
language ["-" script] ["-" region] *("-" variant) *("-" extension) ["-" privateuse].
```

For example, the language hint "**en-t-i0-handwrit**" specifies English language (**en**), [transform](https://tools.ietf.org/html/rfc6497) (<https://tools.ietf.org/html/rfc6497>) extension singleton (**t**), [input method engine transform](http://www.unicode.org/reports/tr35/) (<http://www.unicode.org/reports/tr35/>) extension code (**i0**), and [handwriting transform code](http://unicode.org/repos/cldr/tags/latest/common/bcp47/transform_ime.xml) (http://unicode.org/repos/cldr/tags/latest/common/bcp47/transform_ime.xml) (**handwrit**). This roughly says the language is "English transformed from handwriting." You do not need to specify a script code because **Latn** is implied by the "**en**" language.

Multi-regional support

This functionality currently only applies to the OCR feature (types **TEXT_DETECTION** or **DOCUMENT_TEXT_DETECTION**).

You can now specify continent-level data storage and OCR processing. The following regions are currently supported:

- **us**: USA country only
- **eu**: The European Union

Locations

Cloud Vision offers you some control over where the resources for your project are stored and processed. In particular, you can configure Cloud Vision to store and process your data only in the European Union.

By default Cloud Vision stores and processes resources in a **Global** location, which means that Cloud Vision doesn't guarantee that your resources will remain within a particular location or region. If you choose the **European Union** location, Google will store your data and process it only in the European Union. You and your users can access the data from any location.

Setting the location using the API

Cloud Vision supports both a global API endpoint (vision.googleapis.com) and a European Union endpoint (eu-vision.googleapis.com). To store and process your data in the European Union only, use the URI eu-vision.googleapis.com in place of vision.googleapis.com for your REST API calls:

- <https://eu-vision.googleapis.com/v1/images:annotate>
- <https://eu-vision.googleapis.com/v1/images:asyncBatchAnnotate>
- <https://eu-vision.googleapis.com/v1/files:annotate>
- <https://eu-vision.googleapis.com/v1/files:asyncBatchAnnotate>

Setting the location using the client libraries

The Vision API client libraries access the global API endpoint (vision.googleapis.com) by default. To store and process your data in the European Union only, you need to explicitly set the endpoint (eu-vision.googleapis.com). The code samples below show how to configure this setting.

}
```

To send your request, choose one of these options:

CURL

POWERSHELL

Note: If you are not executing the command below from [Cloud Shell](https://cloud.google.com/shell/docs) (<https://cloud.google.com/shell/docs>) or [Compute Engine](https://cloud.google.com/compute/docs) (<https://cloud.google.com/compute/docs>), ensure you have set the [GOOGLE_APPLICATION_CREDENTIALS](https://cloud.google.com/docs/authentication/production) (<https://cloud.google.com/docs/authentication/production>) environment variable to your service account private key file path.

Save the request body in a file called `request.json`, and execute the following command:

```
curl -X POST \  
-H "Authorization: Bearer "$(gcloud auth application-default print-access-token) \  
-H "Content-Type: application/json; charset=utf-8" \  
-d @request.json \  
https://eu-vision.googleapis.com/v1/images:annotate
```

If the request is successful, the server returns a `200 OK` HTTP status code and the response in JSON format.

Note: Zero coordinate values omitted. When the API detects a coordinate ("x" or "y") value of 0, *that coordinate is omitted in the JSON response*. Thus, a response with a bounding poly around the entire image would be `[{"x": 100}, {"x": 100, "y": 100}, {"y": 100}]` for an image that is 100px by 100px. For more information, see the [API Reference documentation](https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly) (<https://cloud.google.com/vision/docs/reference/rest/v1/images/annotate#boundingpoly>).
